

Airlight^{PLUS}

for racehorses with **MORE** air on the home straights

You know the deal: Your performance horse collapses during the race in the last few metres on the home straight. Due to the huge strain on the lungs, this is often caused by bleeding from the lungs (also known as Exercise-Induced Pulmonary Haemorrhage - EIPH) in race horses such as trotters and gallopers. However indications of lung bleeding are not always as visible as nose bleeds and can only be clearly identified after bronchoscopy.

Finding the right solution: Stable conditions, transport, etc. are just a few of the reasons that could cause this condition. However, finding a solution is no easy task. For prudent owners and trainers wanting to avoid side effects or the risk of doping in general only a few serious approaches are available to fight against EIPH.

We have the gentle solution: AIRLIGHT PLUS is a feed supplement that doesn't focus on energy or nutrition, but on functionality. Vital nutrients ingested with the feed are used in the deepest recesses of the lungs to build up and protect the cell wall and act on the blood-air barrier. To gain the full effect of this approach, the feed must be used over a longer period of time (min. 5 days). AIRLIGHT PLUS acts on and gradually strengthens the smallest areas of the lungs (alveoli) from the inside with every ration at the same time protecting against harmful substances at this oxygen-sensitive area. AIRLIGHT PLUS supports an optimal exchange of gases which also affects performance.

The result is measurable: Initial tests conducted on trotters over a period of 10 days showed both clear improvements in relevant scores (EIPH score) and in mucus formation as an indication of inflammation of the lower air passages. In addition, clear indications in the lung secretions showed the positive effect of AIRLIGHT PLUS and thus a reduction in lung inflammation.

Where and when should I use it: For racehorses in the treatment of lung bleeding and in the long term to stabilise the lower lung areas at times of intensive stress during the race or training

Composition: Choline chloride, Vitamin E, Nicotinic acid, Pantothenic acid, Vitamin B2, Vitamin B1, Vitamin B6, Vitamin K, Folic acid, Vitamin B12. AIRLIGHT PLUS is free of doping.

Dosage: Intensive treatment: 100g (2 measuring cups) per day for a period of 10 days

Packaging: 1 kg box for a 10-day treatment
